1. (6 marks) You are to write a small system for recording students' test score.
   The system has 2 files, data.pl and logic.pl. data.pl stores
   - the score of each student,
   - maximum score,
   - the number of students (count),
   - and the sum of all scores.

   Complete the code for function 'start':
   Assume that we never input student with the same name, this function keeps asking for a student name and his/her score, then updates all data stores in memory, and also prints the average score, and repeat.

   An example run is as follows:

   ```
   ?- start.
   Please enter student name
   |: peppa.
   Please enter student score.
   |: 20.
   Average = 14
   Please enter student name
   |: george.
   Please enter student score.
   |: 17.
   Average = 14.75
   Please enter student name
   |: mello.
   Please enter student score.
   |: 13.
   Average = 14.4
   Please enter student name
   |:

   ERROR: Stream user_input:24:4 Syntax error: Unexpected end of clause
   ?- max(X).
   X = 20.

   ?- count(N).
   N = 5.

   ?- sum(S).
   S = 72.
   ```
